Hi there!

Hadi Gunawan is a skilled software engineer with over 4 years of experience in designing, developing, and deploying web and mobile applications. He is proficient in multiple programming languages and modern software development frameworks, with extensive expertise in building scalable solutions and deploying them to cloud platforms.

In addition to his technical expertise, Hadi excels in soft skills such as teamwork, effective communication, project and time management, and leading teams to achieve project goals efficiently. He is experienced in regularly reporting progress and results to relevant stakeholders, ensuring alignment and transparency throughout the development process. Hadi is passionate about creating innovative, user-centered applications and continuously enhancing his skills by staying updated with the latest technological advancements to deliver impactful and efficient results.

1. Reigare (Landing Page)

This landing page project is built to promote a professional home gas stove repair service. It is designed with a clean, persuasive, and SEO-friendly structure to help customers easily understand offered services, contact the technician, and book service appointments online.

Github Repository (Private Repository): <https://github.com/hadi-projects/reigare-landing>

Key Features:

- Service Overview: Clear presentation of stove repair services, including cleaning, maintenance, and troubleshooting.
- Booking Call-to-Action: Easy-to-access CTA buttons for WhatsApp booking and direct phone contact.
- Testimonial Section: Showcase customer reviews to build trust and social proof.
- Service Benefits: Highlight key value points such as fast response, professional service, and affordable pricing.
- Pricing Information: Optional pricing section to help customers understand estimated costs.
- FAQ Section: Provide answers to commonly asked questions about stove service & maintenance.

Technologies Used:

- Programming Language: HTML/CSS/JAVASCRIPT

2. Wedding Invitations

This online wedding invitation application is a modern and customizable digital invitation platform designed to simplify event sharing and guest management. It provides a seamless way for couples to create and share personalized invitations with guests — eliminating the need for traditional paper cards while offering interactive features and an elegant interface.

Github Repository (Private Repository): <https://github.com/hadi-projects/nandiradanimam>

Key Features:

- Personalized Guest Invitations: Generate unique invitation links for each guest, including personalized greetings and RSVP tracking.
- Public Invitation Mode: Share one public link for general invitees with access to all wedding information.
- RSVP System: Capture guest attendance confirmation directly from the invitation page.
- Guest List Management: Backend dashboard to manage invitees, track RSVPs, and generate custom links.
- Event Timeline & Details: Display ceremony schedule, venue information, maps, dress code, and other event details.
- Love Story Section: Showcase couples' timeline and journey.
- Modern UI & Animations: Elegant UX design with smooth transitions and attention to detail for a premium experience.
- Mobile Responsive: Optimized for seamless viewing on mobile and desktop.

Technologies Used:

- Programming Language: Javascript/Typescript
- Back End: ExpressJs
- Front End: Reactjs, Tailwindcss
- Database: Mysql

Freelance Project - 2025

3. Jago Delivery

This food delivery application is a minimalist web project designed to streamline ordering and delivery for student environments. It focuses on simplicity, speed, and a clean user experience — built to support local merchants and make it easier for students to order meals efficiently.

Github Repository (Private Repository):

Admin Backend: <https://github.com/hadi-projects/jago-backend-laravel>

Admin Merchant: <https://github.com/hadi-projects/jago-merchant-laravel>

Mobile App: <https://github.com/hadi-projects/jago-mobile>

Landing Page: <https://github.com/hadi-projects/jago-landing-page>

Key Features:

- Merchant Management: Manage merchant profiles and menus.
- Product Listing: Display food items with details such as price and description.
- Cart System: Add items to cart and manage orders before checkout.
- Order Management: Handle order flows from placing an order to confirmation.
- User-Friendly UI: Simple, clean, and responsive interface to keep the experience intuitive for users.
- Lightweight Architecture: Built with performance in mind to deliver fast load time and ease of use.
- Modular Code Structure: Easy to extend and maintain for future features.

Technologies Used:

- Programming Language: PHP, Dart, HTML/CSS/JS
- Back End: Laravel-Filament, OSRM(Open Source Routing Machine)
- Front End: Flutter
- Database: Mysql

4. Personal Site

Live Preview: <https://hadi-projects.github.io/personal-site>
Github Repository: <https://github.com/hadi-projects/personal-site>

- Profile: Provides a brief introduction about me.
- Experience: Lists my professional work experience and achievements.
- Tools: Highlights the technologies and tools I use.
- Certifications: Displays my professional certifications.
- About Page: Describes the purpose and background of this website.
- Attractive UI: Designed with a modern and interactive interface for an enhanced user experience.
- Open Source: The source code is available for learning and contributions.

- Programming Language: Typescript, Vue
- Front End: Vue 3, Vanilla CSS, Pinia, Vue-Router
- Build Tool: Vite

5. Wallet Api

Wallet API is a service designed for managing wallet addresses on the blockchain. Currently, it supports EVM chains and offers features such as wallet address generation and transaction creation. The wallet adheres to the BIP39 standard for secure key generation.

Github Repository: <https://github.com/cinnamorollofficials/wallet-api-express-typescript.git>

Key Features:

- **Wallet Address Generation:** Creates new wallet addresses for transactions on EVM chains.
- **Transaction Creation:** Allows users to initiate and manage transactions from their wallet.
- **BIP39 Compliance:** Ensures secure wallet generation using the BIP39 mnemonic standard.
- **EVM Chain Support:** Compatible with Ethereum Virtual Machine (EVM) chains, ensuring integration with widely-used blockchains like Ethereum and Binance Smart Chain.

Technologies Used:

- **Programming Language:** TypeScript
- **Backend:** Express.js
- **Build Tool:** Vite
- **Database :** MySQL
- **Blockchain:** EVM Chain Support
- **Security:** BIP39 Mnemonics

6. Tennet Landing Page

This is the official landing page for my company, developed as a Single Page Application (SPA) using Vue.js. The website is designed to provide a seamless and interactive experience while effectively presenting the company's services and offerings.

Key Features:

- SPA Architecture: Ensures smooth navigation without page reloads.
- Categorized Sections: Organized content with structured navigation in the header.
- Responsive Design: Optimized for both desktop and mobile viewing.
- Dynamic Content Loading: Improves performance and user experience.

Technologies Used:

- Programming Language: Javascript, Vue.js
- Frontend: Vue.js, Vuex, Vue-Router, Vue SPA, Vue PWA
- Styling: Tailwind CSS
- Server: Google Cloud Platform

7. Tennet Vault

Tennet Vault is a secure, cross-platform crypto asset management application developed for enterprise clients. Built using Flutter, it provides seamless access across web and mobile, enabling users to manage their digital assets efficiently.

Key Features:

- New Address Creation: Allows users to generate new wallet addresses securely.
- Internal & External Whitelisting: Supports whitelisting of internal company addresses and external wallet addresses for controlled transactions.
- Multi-Layer Approval System: Implements approval workflows for transactions, both from user-side and internal company-side, enhancing security.
- Transaction Management: Enables users to initiate and track crypto transactions with strict access control.
- Enterprise-Grade Security: Designed with strong security measures to protect digital assets.

Technologies Used:

- Programming Language: Dart, Golang
- Frontend: Flutter
- Backend: Golang, Gin, Gorm
- Database: MySQL
- Server: Google Cloud Platform

8. Vault Management

Vault Management is an internal enterprise dashboard designed for managing client vault operations efficiently. It provides tools for transaction oversight, compliance management, and operational controls.

Key Features:

- Client Management: Supports secure onboarding and verification processes.
- Approval Workflow: Implements multi-layer approval for transactions.
- Transaction Inquiry: Enables real-time tracking and monitoring of vault activities.
- Fee Management: Provides configurable fee structures for different client needs.

Technologies Used:

- Programming Language: Golang
- Frontend: Golang
- Backend: Golang
- Database: MySQL
- Server: Google Cloud Platform

Key Features:

- **Localized User Experience:** Designed to reflect the cultural identity and shopping habits of the local community.
- **Essential E-Commerce Features:** Includes product listings, shopping cart, checkout, and order tracking.
- **Personalized Seller-Buyer Interaction:** Encourages direct engagement between sellers and buyers, fostering trust within the community.
- **Simplified UI/UX:** Focuses on ease of use for users unfamiliar with complex digital platforms.
- **Secure Transactions:** Implements fundamental security measures for safe and reliable transactions.

The project reached approximately 40-50% completion but was discontinued due to certain challenges.

- Programming Language: Javascript
- Frontend: Vue Js, Vuex, Vue-Router, Axios, Quill, PrimeVue
- Backend: Express Js, Mongoose
- Database: Mongo DB
- Server: VPS IdCloudHost

10. Laporan

This project is a collaboration with local government, aimed at creating a platform for citizens to report issues directly to the regional authorities. The application allows users to submit various types of reports, such as public infrastructure issues, environmental concerns, or other community-related matters.

Key Features:

- User-Friendly Interface: Designed for ease of use by a wide range of citizens. Real-Time
- Reporting: Allows users to submit detailed reports with photos and descriptions. Status
- Tracking: Citizens can track the progress of their reports until resolution.
- Administrative Dashboard: A powerful tool for government officials to manage, categorize, and respond to incoming reports efficiently.
- Secure and Scalable Architecture: Ensures data security and supports a growing user base.

Technologies Used:

- Programming Language: Javascript
- Backend: Express Js, Node Mailer, Morgan, Multer, Mongoose
- Frontend: Vue Js, Vuex, Vue-Router, Axios, Chart Js, PrimeVue
- Database: Mongo DB
- Server: VPS IdCloudHost

11. Sivasat

Sivasat is a mobile application developed to streamline inventory management for local government offices. The application ensures efficient tracking and documentation of office assets.

Key Features:

- **User-Friendly Interface:** Designed for ease of use by a wide range of Comprehensive Reporting: Tracks incoming, outgoing, and borrowed inventory items with detailed logs.
- **Automated PDF Generation:** Automatically creates professional PDF documents for each inventory transaction, including check-ins, check-outs, and loans. Mobile
- **Accessibility:** Provides on-the-go access for inventory management via mobile devices.
- **User Roles and Permissions:** Ensures secure access control for different levels of users.
- **Data Security:** Implements robust measures to protect sensitive inventory data.

Technologies Used:

- **Programming Language:** Dart, PHP
- **Frontend:** Flutter, Signature, QR Scanner, Pdf
- **Backend:** Laravel
- **Database:** MySQL
- **Server(Backend):** VPS IdCloudHost

12. Blog Kampus

This project is a simple blogging platform developed within a campus environment. The primary goal was to provide a dedicated space for students to express their thoughts, share knowledge, and enhance their writing skills.

Key Features:

- Student-Centric Design: Tailored to meet the needs of university students.
- Simple Blogging
- Tools: Enables users to create, edit, and publish posts with ease.
- Community Engagement: Allows readers to comment and interact with authors
- Search and Categories: Organizes content by topics for better discoverability.
- Responsive Design: Optimized for both desktop and mobile devices.

Technologies Used:

- Programming Language: Javascript, PHP
- Frontend: Vue Js, Vuex, Vue-Router, Axios, Vuestic Ui, Vue3 Editor
- Backend: Laravel
- Database: MySQL
- Server: VPS IdCloudHost

13. Kasirku

Kasirku is a custom-built Point of Sale (POS) application developed for a small business (UMKM) based on their specific needs. The application simplifies daily operations and improves efficiency in managing sales and inventory.

Github Repository: <https://github.com/hadig007/aplikasi-kasir>

Key Features:

- Sales Reports: Provides detailed daily and monthly sales reports for easy performance tracking.
- Barcode Scanning: Enables quick and accurate product entry and sales processing through barcode scanning.
- User-Friendly Interface: Designed for ease of use, minimizing training requirements for staff.
- Inventory Management: Keeps track of stock levels and product details.
- Secure Transactions: Ensures safe and reliable handling of financial data.

Technologies Used:

- Programming Language: Javascript, PHP
- Frontend: Vue Js, Vuex, Vue-Router, Axios
- Backend: Laravel
- Database: MySQL
- Server: localhost(used locally)
